

Representative grain sampling steps

1. Primary samples are taken from throughout the bulk of each truckload of grain going into the bin
2. The primary samples from each truck are combined to make composite samples representing each truckload of grain
3. The truck samples are reduced
4. The reduced samples representing all the truckloads of grain going into the bin are combined
5. The composite sample represents the contents of the entire grain bin
6. The composite sample is reduced and sealed in containers labelled to show the bin each sample represents
